00:09 **Speaker 1:**

No, I'm fine. Yeah.

00:25 **Speaker 2:**

Hello, how are you?

00:28 **Speaker 1:**

I'm good, I'm good. How are you? I'm audible, right?

00:30 **Speaker 2:**

I'm good. Yes, you are audible. You might get a note taker from Fathom sitting in the waiting room.

00:42 **Speaker 1:**

Okay. Okay, let me admit this.

00:46 **Speaker 2:**

Yeah, thank you.

00:48 **Speaker 1:**

Great. Yes, no problem. So I think another Harsh was supposed to join also from my team, but I don't think he might be stuck into other things. And Manish may or may not join. He's a bit busy in other things. So I'll be taking the lead on this. Just to quickly summarize what the agenda of the call is, I've learned that I just joined the team recently at Shopwise and within the product design team and I just want to get a good understanding of one of the more active users, one of our favorite users that you are. And, and I wanted to see how well you're using the product. What are the things that interest you, excite you? What works, what doesn't work? Just a broad overview and yeah, from here I can start. So because of the broad. Yeah, sorry, go ahead.

01:38 **Speaker 2:**

Yeah, it's on a broad, on a broad level, a lot of these features that are kind of fine tuned and streamlined for users like us and the fact that I work on from like an agency perspective. Right. It allows for a lot more attacking it on quite a few, many different fronts and especially with different clients having different requirements and tackling new issues and things like that. Now with image generation, yeah, there's, there's a lot of ups and downs. There are some situations where it's like one step forward, two steps back. Especially with like working with like the sari space and things. Something I worked heavily with Nambi and Madhu Madhur. So we worked quite, quite extensively on like creating a special space for saree. Because when it comes to Indian ethnic where there's a lot of intricacies that do not get captured, it allows for a lot more room for error and hallucinations

and things. Now obviously that is the LLM side of it. But when it comes to the UI and red side of it, I needed things like certain checkboxes to be checked off to be clicked and things. So I'm currently right now, even with the spaces side, I'm trying to build a space. So let's say you've got a website banner for a flag. Okay. Now in fact I'll share my screen as well.

03:09 **Speaker 1:**

Okay.

03:10 **Speaker 2:**

And.

03:21 **Speaker 1:**

Yes, your voice broke a little bit, that's all.

03:25 **Speaker 2:**

Oh, you can see my screen now.

03:27 **Speaker 1:**

Yes.

03:29 **Speaker 2:**

And you see my screen. So, for example, let's say this is one of our flags, right? Go to the main page. This is the home page. Now I. This is the banner. Okay?

03:50 **Speaker 1:**

Okay.

03:56 **Speaker 2:**

This is the banner state. Now. Now, you always have a website and you have a mobile app. So there are two different. So let's go to, for example, this one here. You see how this banner looks? This is a mobile banner. Right. This will create a. Separately. Now it's the same or similar image. For example, I have only this one. You can see it's the model holding a bundle or a plant on the website. It is.

04:51 **Speaker 1:**

One thing. Can you hear me?

04:56 **Speaker 2:**

Yeah, I can hear you.

04:57 **Speaker 1:**

Yeah. Your voice is, I think, breaking a bit. I don't see that. Any problems on my connection? Yes, it's on my end.

05:08 **Speaker 2:**

It's on my end. Is it fine now?

05:10 **Speaker 1:**

It's a bit better, yes.

05:13 **Speaker 2:**

Okay, sorry. So you can see that this is a different image altogether. So my idea for this was to

create a space with like, with a checkbox that allows me to be like, how many models do I want in a particular image? If I had one model, it's fine. I can do that on any other image solutions. For me, what I needed to know was how do I click on those things to add those assets to. There's a lot of back and forth here, but the UI has been improving across the. Across the. Across the board with agents coming into play. It allowed for a lot more streamlining of like, okay, I can give this job to this person. I can get this stuff sorted out. And it made it. Made that process a lot more easier. I also didn't give quite a lot of UI recommendations when it came to like, for example, you see here with Gavin, there is a. There's a section down here saying Ask Gavin. And there's like a open text box. And that isn't there in. That's not there for Richard. But Richard has specific things now for Richard, for me to have conversation with Richard. You see the section here that Ask Gavin recipes?

06:28 **Speaker 1:**

Yes.

06:31 **Speaker 2:**

That isn't present for Richard, which means for me to have any interactions with Richard, I'll have to go and start it as a new task. So essentially it. It takes a bypass. So if the task will first go to the orchestrator, the orchestrator will then figure out, okay, this task is for Richard and then connects Richard to it. So there's a. There's an extra usage of processing powers and delay in or possible potential loss of context because it's going. It's Getting. It's having a middleman. So that is one UI thing that I've given feedback to.

07:14 **Speaker 1:**

Okay, okay. This is something, by the way. It's about. It's about to improve a bunch of things like especially the left panel and how you access some of these features. But the broader point on the orchestrating the agent part and just even going into a single agent and trying to get something done, you're saying that because of inconsistencies in how you approach the agent and how you get started with the work itself is a big problem, right?

07:42 **Speaker 2:**

Correct. It creates agrees processing and threat count, essentially capacity that it needs to hold as part of the context of the conversation. Now, what I'm facing because of that, especially with Richard, and I think this could be one of the key factors is because it's going through Orchestrator and then going to Richard, is it's losing the semblance of context. Because it's losing context, I'm not able to continue my work. I've got a lot of pending backlog jobs because Richard does not go past a particular point because he loses context or something like that. And this is something I'm based on. Tackle all of this this week. But, yeah, but that's from the technical side. That's nothing to do with your design and ui. So, yeah, we can move on slowly to the UI side. I do like how it's how all these aspects have improved. The UI for agents have improved quite a lot. And it's great. I haven't found any issues with it because I raised a lot of this two, three, maybe four months ago, and it has been improved based on my recommendations and feedback that I've given along with it.

09:02 **Speaker 1:**

Yes, yes.

09:03 **Speaker 2:**

But I think. I think Manish was talking to me specifically about the routines. Ui.

09:08 **Speaker 1:**

Right, yes, that's what I was getting into. So just to be clear about this, are you. When you started using your routines, you're already using agents for different things, right?

09:19 **Speaker 2:**

Yes, yes, yes, yes, yes. Okay. So I had, in fact, I had actually set up a few jobs beforehand too, I think. Yeah, there were some jobs that I set up beforehand. Now what I've done is. So you have the daily audit. Where is my daily audit? So the daily audit system manager, basically from the system. Now, I wanted. I created a separate job here. Now, this separate job includes certain. A bit more parameters and things like that. That doesn't necessarily. How do I say this? It's not on top of what the system managed daily audit for Gavin. Because Gavin just says, okay, fine, this is what you get. It gives you a. It's basically dashboard data. It compiles and it analyzes and compiles. A little bit more streamlined. Here's a nutsh, sort of. But what I want is I want actionable recommendations based on your analysis. I understand the dashboard. And because this is AI, because it's AI, it's artificial intelligence. That is intelligence. It's not just reorganization of creating the dashboard. I wanted to give you a recommendation like actionable recommendations. Therefore, I created a separate prompt. What I was initially trying to. And this is what brought money to the table was in this. When I click on this. Now, it says instructions optional. Now, that text that I showed you in the additive job that I'd run, I pasted that here, but it wasn't saving it. It said it saved, but it doesn't save it. Okay, so that was. There was some disconnect there. And there's something. Manish again said it's a technical bug, he will fix it. Whatever. It's still not fixed. But he said he'll fix it. Okay, but so instead of waiting for that, I created that as a separate job on top of. On top of the already running daily. So it runs this at 9am, 8am and then run this at night. So it'll give me actionable stuff based on that. So this is. So you can see how this. It ran today.

11:45 **Speaker 1:**

Just to be clear on this, these was the ones. The job that you created before the routines thing?

11:52 **Speaker 2:**

No, no, no, I haven't created any jobs before. Routines, I think. No, wait, it was what was called before it was called Jobs. Right?

11:59 **Speaker 1:**

Okay.

11:59 **Speaker 2:**

Yeah, it was called Jobs before. It was called Jobs before, not routines. It was called Jobs. And there were a few. But then I stopped it because there was some issue with like credit leakage. Every time it ran, it kind of pulled like a couple thousand credits.

12:14 **Speaker 1:**

Okay, okay.

12:16 **Speaker 2:**

So I stopped it at that point because I was like, okay, still under construction. I'll leave it at it. Then it was renamed as routines. And this is the new UI for it.

12:27 **Speaker 1:**

Right, Right. Okay. So here, when you started using it, I'm guessing you from over time, you started adding more and more routines. So two things. One is what are the types of routines that you find the most value out of? And maybe let's start there and then we move from there.

12:47 **Speaker 2:**

Okay. I haven't, I haven't explored quite a lot. I've just got these system run runs, a few of them. What I've, as I told you, I've created an added Daily ads audit updated. A weekly audit. Now again, this one is different. Different actionable recommendations based on a weekly analysis of the ads. And then I've got a monthly. Yeah. The rest of the stuff is system managed. I haven't included or played on with a lot more routines because right now I need my routines to be tied to Richard. But Richard right now seems tied to Richard, but Richard right now seems fairly broken. Every time I try to run something with Richard, it breaks. It kind of loses context. So if I run it at the job, I'm just. I'm just spending credits with nothing. Nothing actionable or coming out of it. I'm not getting any user. So until Richard kind of gets a fix from Prashant Steam, I don't see. I don't seem comfortable enough to create jobs for Richard.

13:53 **Speaker 1:**

Okay.

13:54 **Speaker 2:**

Now I'm running jobs for Gavin only. Custom jobs.

14:00 **Speaker 1:**

Custom jobs, yeah.

14:02 **Speaker 2:**

The rest of it is systematic. This is the head which is managed.

14:05 **Speaker 1:**

Yes.

14:08 **Speaker 2:**

I haven't done anything. Now this one is like this one was, I think, I think this one I've already stopped. This was the previous thing when it was full jobs. Supposed to create SEO meta title and descriptions and run it in batches of I think 20 or 50 or 100 SKUs. 100 SKUs every, every day. But it wasn't doing the job, so I had to stop it.

14:39 **Speaker 1:**

Okay. Okay.

14:41 **Speaker 2:**

It had broken quite a bit.

14:44 **Speaker 1:**

Okay. So when it comes to the ones that you find value out of are just the ones where. Which is extracting information and giving you it in a more digestible form and maybe some actionable insights mixed into it.

14:56 **Speaker 2:**

Correct. It has, it has to give me actionable recommendations. If it doesn't give me actionable recommendations, I do not consider that run a successful run. If it doesn't give me like, okay, the recommendations are, okay, this ad is not running so well. So there's. I created something called a ktk, ktk KTK method, which is kill, repeat or kill, tweak or keep. Now kill is you. Basically, it's not running. It's not. It's not useful. You have to change it. You have to go back to the drawing board, kill that particular add on the tweak. When it comes to tweak, either I am changing like the

audience, target audience. I'm changing certain little values within, within the. Or I'm changing the amount of budget I've got it. Whether I'm listening it or increasing it. That's my tweak. Now key, because let's say it's not got enough data to make an actionable recommendation. Okay, let's. Let's keep an eye on this. Let's watch this for another day or two or another week, and then we'll come back to. Come back to this and we'll run it through the TTK method and see whether we are tweak it or again, keep watching.

16:15 **Speaker 1:**

Okay. Tilt we can keep. That's the format you use to sort of assess.

16:21 **Speaker 2:**

That's the format. That's the method I've created for two people to kind of benchmark my successful ad. Benchmark my ad performance model.

16:33 **Speaker 1:**

Okay. Okay. So this is something which is more internal that you have for your overall workflow. And here you're also applying that for my personal workflow. Yes, yes. And here you're pretty much applying it to the routines that you've already set with Gavin that actually work. Correct. Okay, got it. Yeah. So about the part where you mentioned that it should also connect with Richard. So what is the ideal flow that you are looking for in this case? Like, let's say Richard is working the way you intended. What would it look like?

17:11 **Speaker 2:**

Okay. All right, so let's do that. Now, for example, I want to create a routine. Now let's say. I know, I know I'm creating a routine for. Let's say this is for SEO meta. Try to sweep and update. Okay, now here I give instruction saying in batches of 50 SKUs, run an audit of SKUs that do. Do not or. Or have inefficient meta. SEO, SEO meta titles description. For example, okay, now here I know it's for Richard. I should be able to be like, okay, who's this agent targeting for? Who's this prom. Actually an optional thing. It doesn't require thing. I need to be able to be like, okay, this is. Should say agent here. I should be able to click on it and be like, oh, I need to know. And okay, maybe it gives. Or maybe. Maybe you'll give me a plus sign. Maybe it's. Maybe it's for Richard and say Monica, maybe it says, okay and update the PDP coverage our image based on the current trending season or something. For example, okay, okay. And maybe I'll say maybe I put a Pinterest pin link here, like trendy, like. Like a board that says all trending, whatever. And then I have a plus sign here. I click on the plus and I get another doctor. I click that doctor and I select monitor. So now the agents are attached to. This is Richard and Monica. Okay. And then I Can do my frequency. Okay. How often do I want to do this? Which day of the week? Okay, all this, this is perfectly fine. Send notifications, perfectly fine. I can select where I don't want the notifications to come. This is perfectly fine. And then I go ahead and create the routine. So at least now if I do it this way, now I'm reducing. This is if I know about. And obviously when you keep the agents thing as optional, that'll allow me to be like, okay, cool, I don't, maybe I don't know which agency I need to. Then I'll just leave that completely back. I won't, I won't bother with it. I'll go ahead and create. Okay. Unless the system decide who needs, who needs to attach. But if I know it, if I can streamline, if I can make my efficiency and my efficient process. Well, if I make my process efficient, I mean, that's all the more matter for me, right? It's, it's kind of looking at both. If I'm a new user, I don't know, if I don't know which agents or whatever or what is the capacity of an agent, then I can leave it blank. But if I do know it, I should be allowed to allow to target my requirement, improve its efficiency.

20:28 **Speaker 1:**

Just to be clear, when you're trying to target to a specific agent, is it more so that you want like, let's say you're over here is Gavin and Monica now if the users or anyone who's using this gets them recommended automatically, that is fine for a new user, you said, but you want them to be targeted. Yes, you want them to be targeted.

20:52 **Speaker 2:**

I want that option available for me to select and have that semblance of control when it comes to what I want.

21:02 **Speaker 1:**

Okay. Okay. It's a matter of control and just confidence that, okay, this is where my task is going. Exactly.

21:08 **Speaker 2:**

Because so that it doesn't, it doesn't include a lot more middleman. I don't want the office trader to get involved and be like, oh, maybe this is a job. Maybe this is a job of big head. Oh no, it's definitely not a job of big head. So I'm losing a lot of like time. I'm losing credits because there's a lot of crossing power that happens there. There's a cost attached to it. It's unnecessary.

21:28 **Speaker 1:**

So every decision you take has to account for the credit cost. And that makes it all the more difficult if. Yes, yes, yes, it does. So because of this, you have to be very, you want things to be more agent efficient, less the number of steps, the better you feel. Is it fair to say that you feel more confident or maybe less stressed about the credit part of the costing part if the lesser number of agents are involved at a task?

21:58 **Speaker 2:**

Yes, if I. If. Yes, absolutely, yes.

22:03 **Speaker 1:**

Lesser agents, lesser steps, lesser scaffolding. And that would just. Would mean that lesser credential run out, correct?

22:11 **Speaker 2:**

Yeah. Lesser credits. And it's not the credits predominantly for me, there's lesser chance of it losing context of the job.

22:20 **Speaker 1:**

Okay.

22:21 **Speaker 2:**

It's like, you know, you know that there's a. There's a game that kids play. You know, one person whispers something in one person's ear and then that goes down the line.

22:30 **Speaker 1:**

Chinese whisper.

22:31 **Speaker 2:**

And then by the end of it, it just completes completely a different thing. What the first person said. Right?

22:35 **Speaker 1:**

Yes, yes.

22:38 **Speaker 2:**

Yeah. That is essentially what has happened.

22:41 **Speaker 1:**

Okay. Okay.

22:42 **Speaker 2:**

And I want to reduce the number of people that it needs to go through so that my. So that my job that I asked for is the solution that I get.

22:51 **Speaker 1:**

Okay, fair enough. So this is the primary, like, what's it would you say thing that is stopping you from moving outside of Gavin and creating routines. One is the bunch of bugs and issues and the quality of output is just not there.

23:07 **Speaker 2:**

The technical side of it.

23:08 **Speaker 1:**

Yes, yes. But if that is also approved, you still want to have the confidence and control that you're giving the information to the right agents, saving tokens and maintaining context as well as possible so that you get the right outcome no matter what. Yes, okay. Okay, I understand. And I think this gives me. So also, by the way, you mentioned more about Gavin and Richard use case. Do you think you will be more interested in anything which is Monica or bigger related creating routines of any such sort?

23:46 **Speaker 2:**

Yeah, with Monica I don't want to create routines. For example, you see, I showed you the banners I want to be able to create. So I've got, I've got banners like the workwear collection and, and like the fresh editions or like there's a new collection or like a sale collection. Those are, those are like annual collections. They don't keep changing. I want to be able to create a job where Monica is Monica and Richard essentially, again, Richard comes into play here because Richard will have to fetch that particular collection. We monitor the available SKUs that is there, maybe even involve Gavin into the mix saying, okay, fine, these are the ones that it's running ads for. These are their skills is running ads for. These skills are part of that collection. And if the shirt can corroborate that this is part of the collection and you've had X number of these products being sold in the last four weeks or whatever. Maybe you can. Maybe it'll be like, okay, use this for the creation of the next banner. And then every week my banner will automatically keep changing because my routine is run. And Monica can be part of that where she creates the banner, adds required text, the logos, et cetera, et cetera, sends that back to Richard and Richard can automatically update, update the backend store where the banner can actually change.

25:10 **Speaker 1:**

Okay. Okay, I see.

25:11 **Speaker 2:**

Does that make sense?

25:13 **Speaker 1:**

I think it does because you're basically trying to what you would do individually with agents or even just yourself something you're trying to see where else these agents can come in and basically automate what are you doing. Right. Creating the entire workflows, connecting these items together and ultimately it all ends with Richard somehow. Is that fair?

25:34 **Speaker 2:**

Because it's connected. Yeah, it does, it does. Because Richard is the closest to. What do you say? The closest to publishing? Yes, because Richard has the writing, the rights to write onto the shop. So, so basically what I was saying was, okay, so you've got the Richard Monica. Okay, let's just keep, let's make it simple. Let's just keep these two. Collection of. I'm just going to say a new collection here. Okay. Annual collection. Collection of. Annual of new. With SKUS to monitor, Monica creates banners. Now here there's a desktop banner which is landscape plus mobile banner which is portrait and then sends this back to Richard. Richard. Richard edits Shopify theme and updates. This is one job. This is one job that I can potentially run maybe once a week. Once, maybe, maybe one twice a month. You know, every fortnight exchanges.

27:25 **Speaker 1:**

Okay. Depending on how frequent your collections with

27:28 **Speaker 2:**

new collections want to make it.

27:32 **Speaker 1:**

Okay. And you did not mention Big Head. I noticed that.

27:38 **Speaker 2:**

Is that something I'm still working on? I'm still working on Big Head. So right now it's work it's doing. All it's doing is doing a weekly sweep of the GEO score. I do have quite a lot of articles that I need to review and then post. Currently, I think. I have created it. It's kind of working on improving its thing. I've created the whole aspect of it. I've published a few of these articles as well. But the thing is there was one article which was. See for example, this one. Now I don't know why it's not got this image thing. Does it? I mean, I know this is just machine reading stuff. It's not for people to come and view it, so it shouldn't matter. But for me, I have this, this, this thing about consistency. I want to maintain consistency on what is there. Yeah, the look and feel and the information that's being passed along. I wanted to be, I wanted to be specific to. Actually what we did was there was a change in the direction the brand wanted to take. It was a bit more on the ethnic side of it, heavily on the ethnic side of it, blah, blah, blah. But now it's kind of shifting, phasing out the heavy ethnic stuff, but keeping some of the ethnic stuff and moving more towards Indo, Western and fusion work. So I have to change the language and the notion that Big Head has to take when it comes to creating these things. Now coming back to that, I've created a brand language and writing rules for it, giving it some understanding of what the new guideline needs to be. So the new brand, North Star vocabulary, voice, rules and things, I've added all these aspects into it and it still, it's just to give me a few more writing samples. It needs to give me a review part of that. But Jio has been like maybe 10, 10, 10 to 15 of my time. Monica, frankly has been just about 5% because Monaco is. I don't think it's at the level that is what I would like to kind of take advantage of or kind of rely upon quite heavily.

30:10 **Speaker 1:**

Okay.

30:11 **Speaker 2:**

Right Now Monica's about 5%. I've got Gavin at about 30, 40 and the remaining I've got the Richard.

30:23 **Speaker 1:**

I see. So just to quickly circle back on the Monica thing, the part that you, you don't like is. Is it the. There are certain categories that you just can't tackle that well. For example Indian ethnic categories or is it something that overall not just that

30:41 **Speaker 2:**

I just, I don't. I feel like Monica isn't there. I think it needs a lot more updates, it needs a lot more fine tuning with it. Because when my call I, as I said, I've become giving most of my workload to my colleague kind of do when it comes to Monica and image creation and spaces. I work on improving the efficiencies or trying to break the existing workflows either with the shoppers or with my clients or I focus on trying to find gap within existing workflows and design workflows, whether it is a UI aspect of it, whether it's the technical aspect of it, whether it's very interesting process where I have to back and forth a lot and if I can find, if I can find a pressure point or if I can break that process over something, I tend to break it and then obviously reach out to the respective person. Hey, listen, I broke this because the gap here, that is what I kind of focus on when it comes to my day to day.

31:40 **Speaker 1:**

Okay.

31:40 **Speaker 2:**

And I use Richard and Gavin kind of maintain performance marketing and website. But even in that, I know that Gavin recently was able to launch ads by itself directly onto matter. But when I tried it, I found a way to break it. And I reached out to the team, I told them, yep, I've broken the thing. It's not working, it's losing context. I need assistance on this and otherwise I already need to let me know how long I need to wait before I can try to test it out. So basically I'm. I'm just basically sort of like a extreme quality tester where I basically aim to break something.

32:22 **Speaker 1:**

Okay. And it just tends to be the case that Gavin and Richard, despite the problems are. Seem to be breaking less. You would say they seem to be breaking less.

32:34 **Speaker 2:**

They have grown a lot. Monica was breaking quite a lot because even though there is brand language that's included, there's brand memory as part of it, even then Monica kind of loses context. I don't know why I can't see any of the history, which is very weird. I wanted to show you something that I tried with Monica a while ago, but I just can't see.

32:55 **Speaker 1:**

Maybe just click on any other agent or maybe just click on new task. It might be a bug. I don't know why this is happening. I think they just updated the interface. Maybe this might be something to be fixed or maybe it is wipe it out. No, no, definitely it was just a facelift. Yeah, there was some small feature changes here and there, but mostly it's a Facebook part.

33:32 **Speaker 2:**

One other thing that I have not tried is skills. I have not tried skills as of yet. I need to create it. I

have. I've. I need to figure out how to work skills. I don't have aspect. I don't have any time or interest in it right now. But still, this is something I think my colleague Pratik is working. I haven't tested Creative Studio exactly, but I've been working exclusively on spaces. And as I said, I'm also working on try to create a space too this one one day. So this was me trying to create a space for. I mean this, this, this UI is, is amazing. Like, I really like this because I've done a lot of game development stuff on Unreal Engine and just using noodle nodes and things like that is really good. Now I'm glad I have you here. Now I've got this one connected to here. I've got this one connected to here and here. See this?

34:37 **Speaker 1:**

Yes.

34:38 **Speaker 2:**

I want to remove this one. I want to remove this. I want to remove this node, this connection. How do I remove it? I can't remove it. Once I've attached it, I cannot remove it no matter what I do.

34:52 **Speaker 1:**

Okay. This is custom. Yeah. Okay, go ahead.

34:57 **Speaker 2:**

Yeah, I mean I should be able to like, like what, what Unreal Engine has is I can, I can, I can press control and I can drag my mouse so it creates like a little scissor things. I can click and remove it like a delete button. But yeah, this is what I'm creating the space for. As I said that same thing I told you about with moniker. I'm creating a space here where I have this number of skus which if I say I have three. So this will be like, okay, I want to put 3, 3 SKUs in. Within the same. Within the same image. And once I put that in, I should be able. This should give me. This is. It should give me three of these. One, two and three. Okay. Depending on what number is attached here. So this, I should be able to attach this to a value here. Now when it comes to this number of images then I can be. Okay, here's a reference image of what I want it to look like. So I could pump this into maybe this one. I should actually be able to pump it into the brief. Once the banner brief is then created, I say, okay, fine, created. It should create both a landscape banner and a portrait and then allow me to, allow me to download. That is my workflow here, which I still haven't been able to.

36:25 **Speaker 1:**

So this is something I believe it would be better suited if you chat this out because the most of the people are not that comfortable with the node based workflow. I mean I know you are because of your game development background, but mostly here.

36:39 **Speaker 2:**

Yeah, you see this? It's not able to. So I keep going saying the number of skills not connected to the product is caged. You're right. Blah blah, blah. This hits a bunch of errors. So this is my needs manual collection. Then the manual connection is. The flow is wrong. The flow is complete. This is one of the things, one of the UI elements that potentially has room to go.

37:03 **Speaker 1:**

Yeah, I mean 100%, yes, 100%. Both of these needs to be fixed. I'm just pointing out the Fact that the workflow bit is a bit complicated. I'm not sure how quickly it can be done. But the other part, maybe it can be handled like you're speaking with the engineering team already. So they can probably figure these problems out.

37:25 **Speaker 2:**

Well, most of these are all technical issues. When it comes to ui, there has been significant growth over the last three, four months.

37:37 **Speaker 1:**

I see, I see. Okay, so I think I've got enough information in on a broader sense and especially on the. The routines front, which is what I was more interested in. The thing is, I would like to in the future also have a chat with you. Okay. Now the history is visible. Yeah. If you want to show something.

38:01 **Speaker 2:**

I was about to, but I don't know if I. It was about Monica losing complete context.

38:10 **Speaker 1:**

Okay.

38:13 **Speaker 2:**

This is another thing, man like me trying to find something here. I can't even stretch this out, expand this out. You see this? I can't expand my type bar for me to kind of see what the dot, dot, dot is. This only way I can do it and do it is click on it. But if I click on it or make any changes, it comes to my most recent history. This one. Oh, I'm seeing this one. This is different.

38:45 **Speaker 1:**

There are a few bits added here and there throughout the facelift. Like this one.

38:52 **Speaker 2:**

Okay. This is pretty decent. Okay.

38:56 **Speaker 1:**

Yes.

39:01 **Speaker 2:**

It's not a space. It was in chat. It was an in chart, cross process with Monica. Just. You're on Slack, right?

39:15 **Speaker 1:**

Yes.

39:23 **Speaker 2:**

I think it's this one. You see this? These are not my brand's outfits and this is not the brand's language.

39:33 **Speaker 1:**

Okay.

39:33 **Speaker 2:**

You see that? This is not even. This is not even a product that we have on our.

39:41 **Speaker 1:**

Okay. Okay.

39:42 **Speaker 2:**

So my main thing was, you see this with Monica, design a seasonal campaign, blah, blah, blah. Because I want to see if you can create a hero image, create a campaign around it and then maybe I can go ahead, I can work backwards, create the image of the campaign. I will feed this, I will send this to the team. The team will then create a collection based on this and then they will let me know when the collection is ready. In the meantime, I work with Monica to create ads and creatives. I work with Monica to create maybe maybe add deals like minimal movement and things like that and create banners and sub collection banners so that I can update on the website once the campaign and the collection is ready. I see that LinkedIn to Monica. Monica will then have to coordinate with Richard to kind of add these and update the Shopify website at the same time. Monica Will then have to coordinate with Kevin to take off your account. This is. This was the potential process, but as you can see, it's kind of. It's just. This is not the brand language memory enabled and everything is enabled.

40:54 **Speaker 1:**

So it's still missing the mark.

40:57 **Speaker 2:**

It's still. It's still missing. Which is why I stopped using Monaco. So what I essentially do now is I work on. It's still. It's still a fairly manual ish kind of process because what I need to work on is I need to create things using spaces and then once I've created it using spaces, I can bring it back here on Canva. Right. Because the text is not giving me the correct kind of text and there's like a flow of text that I need to do. So I got like, okay, this is. And I need a particular. There's a brand low. What is it? Typography that needs to be used.

41:33 **Speaker 1:**

Okay.

41:35 **Speaker 2:**

And those things. So you can see here. Okay, fine. This is the thing. This is my format. There's always a button that's explored now. Size of the button, the location of the button, etc, these are all aspects that I need to manually change and do before I can make it bold.

41:54 **Speaker 1:**

That still adds a significant effort on your end, regardless of how well the images.

41:59 **Speaker 2:**

Because it's not. It doesn't end here. I need to then download this in png. I need to then change it from PNG to webp format and then I need to go back to my. Go back to my store and then change it manually.

42:16 **Speaker 1:**

Okay. That's a massive workaround.

42:19 **Speaker 2:**

So if I can. This is the workflow that if I can get richer to do, it will

42:27 **Speaker 1:**

reduce at least one step.

42:30 **Speaker 2:**

Yeah, easily. Easily. Yes.

42:34 **Speaker 1:**

I see. And then there's this text generation part which is a bit. Which is a big hassle on its own.

42:41 **Speaker 2:**

And it is quite janky, isn't it? Like the text side of it is quite janky. Where did it go? I lost it. See the text here? It makes no sense. Text based on Youth Next Summer campaign with your Indian Summer s is kind of the copper part of it is gone.

43:01 **Speaker 1:**

Yeah. Makes no sense. It's like all over the place. You might as well not use it at all. I get your point.

43:07 **Speaker 2:**

Yeah, exactly.

43:09 **Speaker 1:**

Okay.

43:10 **Speaker 2:**

Okay. Yeah, fair enough.

43:13 **Speaker 1:**

I think. You know what, I do want to deep dive on to with you on some of these specific agent specific workflows that you have, but I think we're short on time right now. But since I was more focused on routines. Yeah, I was more focused on routines this time. But I would like to circle back like periodically if it is possible that we can keep taking at least affecting something.

43:35 **Speaker 2:**

Yeah, let's let me know. I'm. I am available on. If you're on slack. I'm on slack as well. I can speak to Mon to kind of add you on. We can coordinate that. What we can do is we can set time aside just for particular segments or sections of this. Of the. Of what shop offerings are. Let's even sit on routines. We can just sit on just specifically just routines and be like, okay, how do we connect all these agents? How do we streamline it regardless of their technical efficacy of the agents, whether the agents can do it or not. But how do we make sure that we can get the routines thing sorted out so that then the technical team can then connect these things technically to the respective agents so we can set time aside for it. Just let me know when I can start some time out for you and we can.

44:25 **Speaker 1:**

Yeah, I think and give me some time to sort of organize the bit things more on the routine because this is something I'm actively working on currently. But in general I would like to set up these like on maybe schedule regular catch ups so that we can figure out some of these small hiccups to larger hiccups that you might have. But there are a lot of things I can deep dive on. But yeah, it will take a lot of time.

44:48 **Speaker 2:**

Yeah, sure. Yeah.

44:51 **Speaker 1:**

All right. Yeah, so thanks a lot for like it's a very detailed conversation which super helpful and yeah, let's connect later.

45:00 **Speaker 2:**

Yep, sounds good.

45:01 **Speaker 1:**

All right, have a good day.

45:04 **Speaker 2:**

Thank you. Thanks so much. Cheers. Bye bye.
